Surgical Technique Matters!!

Do We Really Have a Problem with Surgery for Colon Cancer?

Outcomes Have Improved for Rectal Cancer not as Much for Colon Cancer

Rectal Cancer

Colon Cancer

Renouf et al, Am J of Clin Oncol 2013; 36(6):558-564.

Recurrence in Colon Cancer

- 30% of patients having curative resection for colon cancer
- Up to 19% are locoregional only
- Many misdiagnosed as peritoneal disease
- Rate depends on the stage
- Diagnosed approx. 18 months after surgery
- Usually in advanced tumors at diagnosis
- Many cases attributed to inadequate surgery

Complete Mesocolic Excision (CME) and Central Vascular Ligation (CVL)

1. Dissection in the embryological plane between the colonic mesentery and the parietal retroperitoneal fascia, ensuring complete removal of the mesentery
2. Resection of an adequate length of bowel to remove involved pericolic nodes
3. Central vascular tie to completely remove all apical nodes along main feeding vessels (smv) (D3)

Hohenberger et al, Colorectal Dis 2009

West et al, J Clin Onc 2009

Sondenaa et al, Int J Colorectal Dis 2014

Problem #1: Resection Margin in Colon Cancer

- pT1 4.5%
- pT2 6.3%
- pT3 10.9%
- pT4 25.8%

Healy et al, Ann Surg 2020; 262:891-8

- Stage II 9%
- Stage III 12%

Goffredo et al, J Surg Oncol 2020; 121:538-46

Pathology Grading of Colon Cancer Resection

- Plane of dissection

- Muscularis
- Intramesocolic
- Mesocolic

- Tissue morphometry

- Length of the specimen
- Tissue area
- Distance of the vascular tie to the bowel wall
- Distance of the vascular tie to the tumor

Pathology Grading of Colon Cancer Resection Association with Survival

- 399 patients with resection for colon cancer
- Only 39% had surgery in the mesocolic plane
- Intact mesocolic plane versus intra-mesocolic plane:
 - 15% improvement in survival for all patients
 - 27% improvement in survival for patients with stage III

West et al. Lancet Oncology 2008, 9 :857-65.

Lymph Node Drainage in Colon Cancer: Summary

- Longitudinal spread in the pericolic nodes can occur up to 10 cm
- Central spread increases from D1 to D3
- D3 nodal involvement occurs in 5% -10% to of cases
- Skip metastasis (D2 and/or D3 without D1) occurs in up to 22% of patients with stage III colon cancer
- Unusual patterns of spread – subpyloric and gastroepiploic nodes – occur in up to 4% of patients with locally advanced ascending or transverse colon cancer
- Aberrant nodes outside the tumor related D1-D3 area are considered M1 disease

Problem #2: Number of Lymph Nodes often Insufficient

Open/Laparoscopic	COST	COLOR	CLASICC	Leung	ALCCAS
Patients	863	1248	794 (413 colon)	403	594
Operative Time (min)	95/150 p<0.001	115/145 p<0.001	135/185	189/144 p<0.001	107/158 p=<0.001

5Y-OS	75/76 p=0.93	74/74 p=0.45	63/56 p=0.253	8076 p=0.61	76/77 p=0.64

Survival Improves with Increasing Number of Lymph Nodes

Stage II

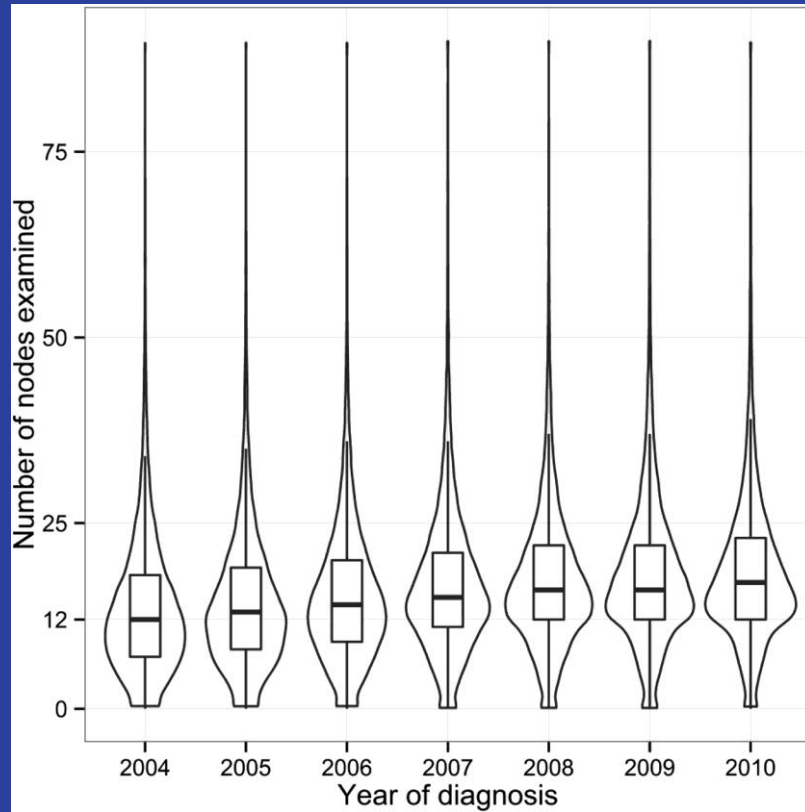

Baxter et al, Ann Surg Oncol 2003;10:65-71

Stage III

Chen S et al, Ann Surg 2011, 253(1):82-87.

Increasing Number of Nodes Did Not Change Staging but Improved Survival

Improvement in survival with each node retrieved which was independent of stage, tumor site, patient age, year of diagnosis

Additional Facts About Lymph Nodes

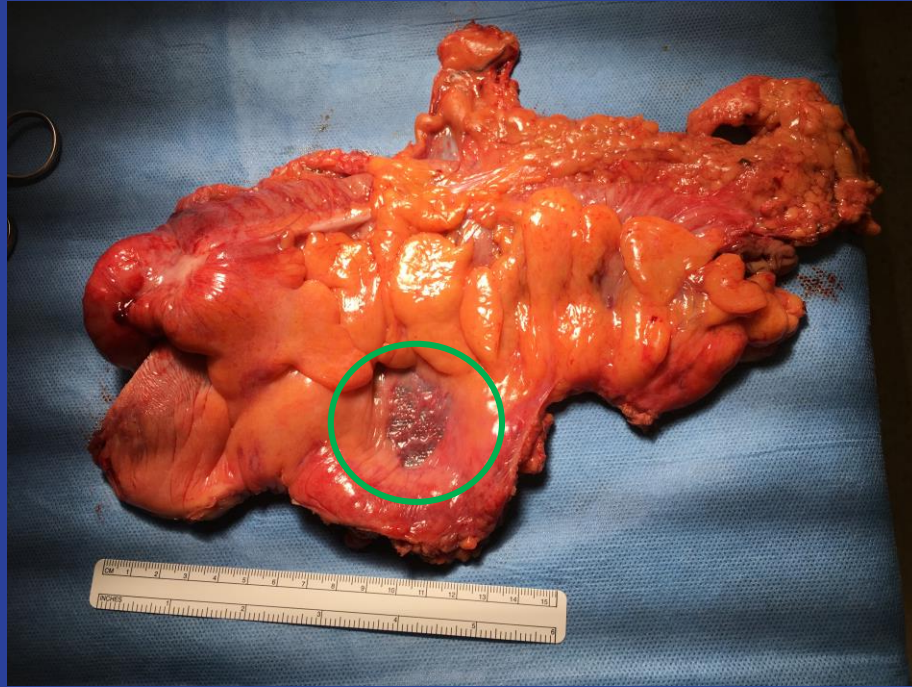

- Central location of positive nodes is a prognostic factor independent of stage III – 60% vs. 85%

Kanemitsu et al, DCR 2013;56:815-24

- D3 (compared to D2) dissection associated with improvement in survival (HR 0.827 [95% CI 0.96-0.90]) in patients with involved central lymph nodes

Kotake et al, Int J Colorectal Dis 2014;29:847-52

CME and CVL Right Colectomy: Pathological Quality Control

Peritoneal window corresponding to the area overlaying the 3rd portion of the duodenum

Ileocolic vessels
Middle colic vessels
D3 lymph nodes

CME vs. Conventional Surgery Danish Population Study 2008-2011

- Stage I–III colon cancer surgery in Denmark
 - Danish Colorectal Cancer Group Database for 1.75 million inhabitants of the Capital Region of Denmark
- CME group (Hillerød Hospital)
- Conventional group (Copenhagen University Hospitals)
- Exclusion criteria
 - Stage IV disease, metachronous colorectal cancer, rectal cancer, tumor of the appendix, or R2 resections

CME vs. Conventional Surgery Disease-Free Survival

Bertelsen et al, Lancet Oncol 2015

CME vs. Conventional Surgery: Morbidity

	CME (<i>n</i> = 529)	'Conventional' resection (<i>n</i> = 1701)	<i>P</i>
Postoperative complications (total)	30.6	28.5	0.351
Surgical complications	20.8	19.3	0.491
Anastomotic leakage	8.5	7.1	0.327
Respiratory failure	8.1	3.4	< 0.001
Injury to superior mesenteric vein	1.7	0.2	< 0.001

 Di Buono et al, Ann Surg 2021;274:57-62
 Planellas et al, Ann Surg 2022;275:271-280
 Degiuli et al, Ann Surg Oncol 2024, 31:1671-1680

Vascular Injuries

- Laceration or break of blood vessel supplying the right colon
- Vascular injuries more common in the D3 group (3% vs 1%; $p=0.045$)
- Blood loss was similar in both groups
- Conversion rate was similar in both groups (3% vs 1%, $p=0.17$)
- Only one conversion in each group was attributed to vascular injury

Lu et al, JCO.24.00393

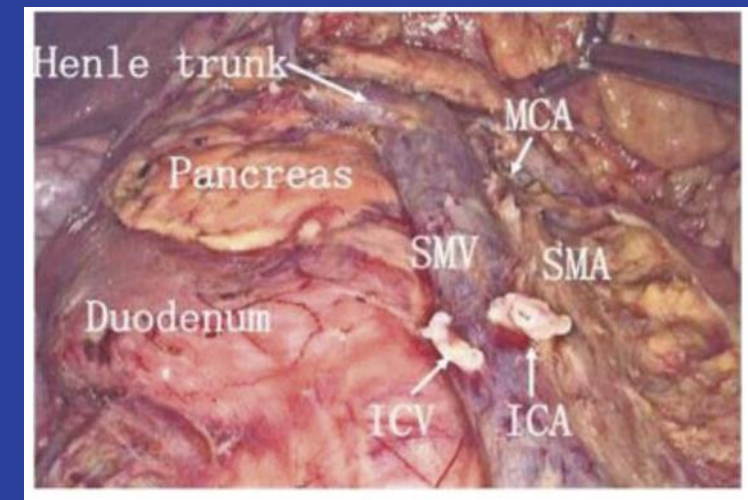

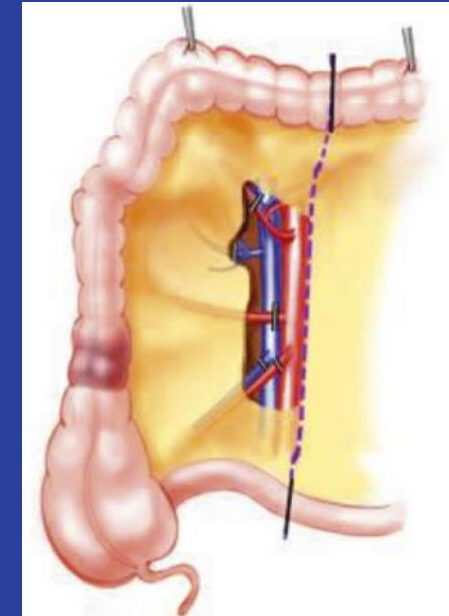

RELARC Trial: Patients

- Inclusion:
 - Colon cancer from cecum to the proximal 1/3 of transverse
 - T2—T4a N any or T any N+ by CT or surgical exploration
 - 18 to 75 years of age
- Exclusion
 - Enlarged D3 lymph nodes
 - Distant metastasis

RELARC Trial: Interventions

CME D2 vs. CME D3

Statistical consideration

- Superiority trial
- DFS primary endpoint
- Sample size calculation based on previous studies
- Accrual January 1, 2016 to December 26, 2019
- 17 hospital
- Skilled surgeons: required to have performed over 100 colon cancer operations a year for 2 consecutive years and to be proficient with laparoscopic CME
- Quality of surgery evaluated by photography

Results:

- ✓ 1072 patients accrued; 77 excluded (25 enlarged central nodes)
- ✓ 995 included in the primary analysis
- ✓ Pathology Stage:
 - I 10%
 - II 54%
 - III 36%
- ✓ Central lymph nodes involved (CME only) 13 (3%)
- ✓ dMMR 19%

Results:

A

No. at risk
(cumulative censored):

CME group	495 (0)	478 (7)	460 (11)	442 (12)	424 (17)	416 (19)	409 (19)
D2 group	500 (0)	478 (4)	450 (9)	433 (12)	412 (14)	399 (15)	396 (15)

B

No. at risk
(cumulative censored):

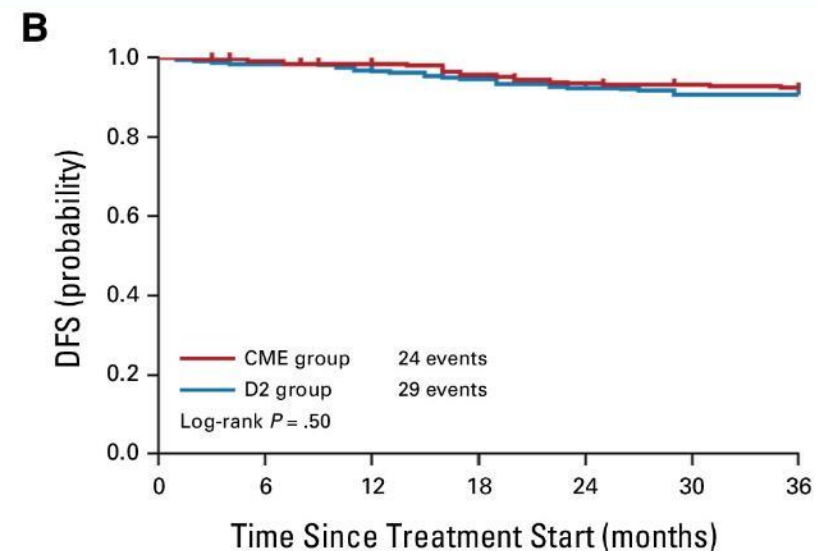

CME group	495 (0)	495 (0)	493 (0)	488 (0)	484 (0)	478 (0)	469 (0)
D2 group	500 (0)	498 (0)	496 (0)	492 (0)	486 (0)	475 (0)	463 (0)

DFS by nodal classification

No. at risk (cumulative censored):

N0	635 (0)	618 (9)	602 (17)	585 (20)	567 (24)	558 (27)	555 (27)
N1	249 (0)	236 (0)	222 (0)	210 (0)	200 (2)	192 (2)	187 (2)
N2	111 (0)	102 (2)	86 (3)	80 (4)	69 (5)	65 (5)	63 (5)

No. at risk (cumulative censored):

CME	315 (0)	307 (5)	301 (9)	292 (10)	282 (13)	279 (15)	276 (15)
D2	320 (0)	311 (4)	301 (8)	293 (10)	285 (11)	279 (12)	279 (12)

No. at risk (cumulative censored):

CME	128 (0)	121 (0)	114 (0)	107 (0)	102 (1)	99 (1)	96 (1)
D2	121 (0)	115 (0)	108 (0)	103 (0)	98 (1)	93 (1)	91 (1)

No. at risk (cumulative censored):

CME	52 (0)	50 (2)	45 (2)	43 (2)	40 (3)	38 (3)	37 (3)
D2	59 (0)	52 (0)	41 (1)	37 (2)	29 (2)	27 (2)	26 (2)

Summary of the RELARC trial

- Expert surgeons
- Comparing best D2 with D3 dissection in patients without enlarged central lymph nodes
- Mostly node negative patients; 19% dMMR
- A trend toward better survival in D3 group without increase in morbidity (study underpowered?)
- D3 superior to D2 in stage III disease (particularly N2 tumors)

A recent case

- 39 y/o female
- Ascending colon cancer diagnosed 10/2021
- CT: circumferential mass in the ascending colon, no distant mets
- Laparoscopic right hemicolectomy
- Stage IIIB
- FOLFOX between 11/2021 and 5/2023
- Since end of 2022 raising CEA, +ctDNA
- Early 2023 new mesenteric lesion in CT and PET

This is not biology; this is inadequate surgery

2 years after R Colectomy
(2023)

Baseline 2021

Salvage mesenteric lymphadenectomy

A case with enlarged central nodes even after neoadjuvant chemotherapy

Problems with the “selective approach” to CME-CVL

- Imaging not accurate enough for the locoregional staging of colon cancer
- Surgeons will have difficulty achieving competency with a procedure performed infrequently

Diagnostic Accuracy of CT for Local Staging of Colon Cancer: A Systematic Review

Parameter	Sensitivity % (95% CI)	Specificity % (95% CI)
T1-2 vs. T3-T4	90 % (83-95%)	69% (63-75%)
T1-T3ab vs T3cd-T4	77% (66-85%)	70 (53-83%
N0 vs N+	71% (59-81%)	67% (46-83%)

Results affected by

- Slice thickness - <5 mm slices
- CT techniques – MDCT

Summary:

- CME and CVL is an embryological-based anatomical procedure
- Routine CVL (D3 dissection) may not provide an oncologic advantage all colon cancer patients
- It may be helpful in patients with advanced disease
- No higher morbidity if standardized after proper training

Many Thanks
